Deep Isolation of Nuclear Waste in Pennsylvania

**Presented by
Jesse Sloane, PE**

The global consensus is geological disposal presents the best solution for safe, permanent disposition of spent nuclear fuel and high-level waste. With traditional mined repository concepts being costly and complex, encompassing decades of engineering work, only a handful of countries are close to implantation. Deep Isolation has developed a novel method for disposal of nuclear waste utilizing directional drilling techniques which are standard practice in the oil and gas industry. This course will provide an overview of Deep Isolation's solution to place nuclear waste in deep boreholes located in geologic formations proven to be isolated from the surface for thousands to millions of years.

Prices using PayPal
Course and PSPE/PIE Certificate - \$5.00
